STATISTICIAN POSITION AT THE PARCC

Team Integrative Epidemiology of Cardiovascular Diseases

Our team is offering a 2y position as a statistician to work on cardiovascular disease epidemiology. This is a 65-staff members team exploring 3 main topics: cardiac arrest, novel biomarkers, and cardiovascular disease in Africa. We are using classical and extended regression analysis (joint and mixed modeling, competing risk ...) together with machine learning approaches. We are seeking for a junior or a senior statistician to complete the statistician team currently composed of 2 members.

You will be involved in several ongoing projects and will work closely with the researchers. The candidate should have at least a Master 2 in biostatistics or equivalent and should be easy with epidemiological concepts (bias), study design, data management and main regression analysis (linear, logistic, Poisson, Cox). Additional skills on machine learning would be an advantage.

We are looking for a highly motivated candidate, independent, with good team spirit and who is able to propose new statistical approaches.

To join the team, please send a CV, a letter of motivation and contact information of at least two references to jean-philippe.empana@inserm.fr
